Suggested Rules of Origin Regime for EAFTA

Erlinda M. Medalla and M. Supperamaniam

Abstract

Determining origin within the context of international trade is not simple. Rules of Origin (ROOs) would involve laws, regulations and administrative determinations to ascertain a product’s country of origin which are not costless to comply with. As such, the criteria used to define ‘origin’ and how it is administered would play a crucial role in the global trading order.

In moving toward the East Asian vision of a community, a rational, enabling regime of ROO that would encourage deeper economic integration and shared prosperity should be established. This means a set of ROOs that is trade facilitating even as it attempts to prevent trade deflection, with enough safeguards for inclusive development both within and across countries in the region.

To provide a clear understanding of the ROO and their proper application, this paper discusses the various approaches in determining the rules of origin. It also looks at the different ROO regimes in East Asia then points out some of the recurring ROO issues. Finally, the paper suggests key features of the ROO for the effective implementation and success of any preferential agreement such as the EAFTA.

Keywords: rules of origin, preferential trading agreements (PTAs), free trade agreements (FTAs), regional trade agreements (RTAs), East Asia
Suggested Rules of Origin Regime for EAFTA°

Erlinda M. Medalla* and M. Supperamaniam**

1. INTRODUCTION

Determining origin within the context of international trade is not simple. Rules of Origin (ROOs) would involve laws, regulations and administrative determinations to ascertain a product’s country of origin which are not costless to comply with. In many cases, many steps, certifications, requirements are involved. And if different ROOs are used for different agreements with different partners, it is not difficult to imagine the intricate ‘noodle-bowl’ effect of these ROOs.

Hence, the type of ROOs, and how it is administered would play a crucial role in the global trading order. Even now, in East Asia (in this paper, this refers to the ten countries of ASEAN plus three countries including China, Japan and South Korea), there are apprehensions that the increasing number of FTAs is creating a complex and inconsistent web of rules of origin that could limit and/or distort the use of the trade preferences. These concerns are well recognized as manifested in the numerous studies and discussions covering the related issues, especially in recent years.

The growing importance of ROO issues in international trade and commerce is driven by a number of factors. First, the globalization of the means of production has made origin determination increasingly difficult and dispute prone.¹ Few products today are made solely in one country, or even within one enterprise, arising from the increasingly globalizing nature of international trade and commerce. Determining the ‘nationality’ of these products and the treatment under various international trading rules are crucial. Second, ROOs are a key element determining the magnitude of the economic benefits that accrue from RTAs and who gets them. Third, there is opportunity to make use of ROO as protectionist tool per se. There has been the increasing incidence of using ROO as discriminatory trade policy tool to protect domestic sectors and intermediate goods. Fourth, the various plurilateral and

° This paper is part of the Phase II EAFTA Study and is drawn heavily from Medalla (2008), a paper submitted to Economic Research Institute for ASEAN and East Asia (ERIA).

* Senior Research Fellow, Philippine Institute for Development Studies.

** Former Deputy Secretary General of Ministry of International Trade and Industry, Former Ambassador and Permanent Representative of Malaysia to the WTO.

¹ What used to be a simple application of the origin of rules became complicated due to technological innovations in communications and transportation permitting the outsourcing by the companies of their manufacturing operations globally. Rarely can be seen a country claiming exclusive domestic inputs of a certain product. (Coyle 2004)
bilateral FTAs in East Asia give rise to the noodle bowl effect of a complex and possibly inconsistent web of ROOs, product standards and conformance requirements and diverse tariff liberalization schedules. (Lazaro and Medalla, 2006)

Nonetheless, despite of all these issues, a regime of ROO is a necessary feature of any regional trading arrangement (RTA). Otherwise, “trade deflection” (the trans-shipment of products from non-members to FTA-members through a low-tariff FTA partner) could occur and the trade preference offered by the RTA is eroded. The ROO regime attempts to prevent trade deflection by imposing criteria that ensures an adequate degree of transformation in a preference-receiving country to justify allowing the good to benefit from the preference.

In moving toward the East Asian vision of a community, a rational, enabling regime of ROO that would encourage deeper economic integration and shared prosperity should be established. This means a set of ROOs that is trade facilitating even as it attempts to prevent trade deflection, with enough safeguards for inclusive development both within and across countries in the region.

There is no internationally recognized agreement on the form of ROO in FTAs. Each agreement has its own rules which are subject to detailed negotiations during its formation. ROOs change depending upon what is negotiated between trading partners. They also vary in their nature and complexity and can impose a de facto barrier to trade. Thus the criteria used to define ‘origin’ are critical to any FTA.

Therefore, a clear understanding of the ROO and of their proper application is of utmost importance for the effective implementation and success of any preferential agreement such as the EAFTA.

2. DETERMINING ORIGIN²

ROO refers specific provisions known as “origin criteria” that are established in international/regional trading agreements to determine the origin of goods being traded. Their importance has grown significantly as the number of preferential agreements grew, and countries increasingly have treated similar imported goods differently according to where the product was made. (La Nasa 1995)

In general, there are at three (3) basic steps followed to set ROO. These are:

  a) A product is deemed as originating from a particular country if:
     • it contains no materials or processing from outside that country, or
     • “sufficient working or processing” or substantial transformation has taken place.

b) Sufficient working or processing is in turn determined by either
   • a change in tariff classification (CTC) rule,
   • on the basis of a minimum allowable value of intermediate imports as a percentage of the value of the final product or
   • on the basis of conforming to specific production processes.

c) Allowable intermediate imports could take the form of
   • Minimum allowable from non-partners to the agreement
   • Cumulation from partners within the agreement.

‘Wholly obtained’ criteria would apply to goods that are clearly produced domestically. These are more easily identified and have clear HS (Harmonized System) nomenclature and coding. They are mainly in the first eight HS chapters covering mining, live animals, fruits, with some processing. Various agreements have more or less harmonized definition and identification of the HS codes covered. The three standards is usually reduced to two – as either wholly obtained or non-wholly obtained, as minimal operation criteria would usually be categorized as “wholly” obtained.

To provide an example, the ROO in ASEAN-CEPT is spelled out under a number of provisions as follows:

- Originating products: conditions 1) products wholly produced or obtained; 2) products not produced or obtained
- Wholly Produced or Obtained: List of qualified products
- Not Wholly Produced or Obtained: Products with at least 40 percent of its content originates from ASEAN Member States
- Cumulative Rule of Origin: Specific conditions
- Direct consignment: Specific conditions
- Treatment of Packing
- Certificate of Origin: issued by a government authority of the exporting Member State
- Review

‘Substantial’ transformation is a generally accepted concept as a criterion for origin for non-wholly obtained goods. Among its advantages are flexibility, evolution over time, and development through application to specific facts in an adversarial situation where interested parties are represented. On the other hand the potential disadvantages include: inconsistent applications, discretionary nature and the costs of making an origin determination under it. The adoption or rejection of particular criteria of substantial transformation as a method of determining origin depends on which principle one puts more value on: *flexibility* or *certainty*. (La Nasa 1995).
There are several approaches to defining whether ‘substantial’ transformation has occurred to satisfy originating criteria. In general, these include three major methods, used singly or in combination. The first is the value-added measure (VA), which refers to the (minimum) percentage of value added created at the last stage of the production process (also the domestic content test). The second is the tariff-heading criterion, also referred to as change in tariff classification (CTC), whereby origin is conferred if the activity in the exporting country results in a product classified under a different heading of the customs tariff classification of the Harmonized System of Tariff Nomenclatures, than its intermediate inputs. This criterion is comparatively simple and predictable, but trade classification systems have not been designed with the objective of distinguishing substantial transformation. The third is the specified processes or technical test, which determines, on a case-by-case basis, specific production activities or specific processing operations that may confer originating status. This prescribes certain production or sourcing processes that may (positive test) or may not (negative test) confer originating status. (UNCTAD 2002) An example is the so-called yarn forward (sometimes from fiber to fabric) rule for textile and garment products.

The advantages, disadvantages and key issues using the different methods are highlighted in Table 1 below as summarized by Brenton (2003).

---

3 The value-added test yet simple and precise can be very costly because to comply with a value-added rule differences in calculation method, fluctuation in values and the compliance costs, the value-added rule requiring tracing, a manufacturer of a complex product would need a highly sophisticated inventory and accounting system to adequately ensure that particular goods contain specific local components at specific values. (La Nasa 1995)

4 While the Harmonized System reflects the most sophisticated and refined tariff classification system, its primarily designed for the dual purposes of commodity classification and compilation of statistics. (La Nasa 1995)

5 This is as good only as a supplemental test of origin because of its rigidity and difficulty of defining a process test for the enormous array of products made and the continuous need to update these rules for new products and technological advances in production. This process is also highly susceptible to capture by industry lobbying groups, because drafters and administrators would have to rely upon the industry for information. Lastly, negative technical tests leave large gray area, in that they only delineate which processes do not confer origin. (La Nasa 1995)

<th>Rule</th>
<th>Advantages</th>
<th>Disadvantages</th>
<th>Key Issues</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change of Tariff Classification (in the Harmonised System)</td>
<td>● Consistency with non-preferential rules of origin. &lt;br&gt;● Once defined, the rule is clear, unambiguous and easy to learn. &lt;br&gt;● Relatively straightforward to implement.</td>
<td>● Harmonised System not designed for conferring origin, as a result there are often many individual product specific rules, which can be influenced by domestic industries &lt;br&gt;● Documentary requirements maybe difficult to comply with. &lt;br&gt;● Can be conflicts over the classification of goods which can introduce uncertainty over market access</td>
<td>● Level of classification at which change required – the higher the level the more restrictive. &lt;br&gt;● Can be positive (which imported inputs can be used) or negative (defining cases where change of classification will not confer origin) test – negative test more restrictive.</td>
</tr>
<tr>
<td>Value Added</td>
<td>● Clear, simple to specify and unambiguous. &lt;br&gt;● Allows for general rather than product specific rules</td>
<td>● Complex to apply – requires firms to have sophisticated accounting systems. &lt;br&gt;● Uncertainty due to sensitivity to changes in exchange rates, wages, commodity prices etc.</td>
<td>● The level of value added required to confer origin &lt;br&gt;● The valuation method for imported materials – methods which assign a higher value (e.g., CIF) will be more restrictive on the use of imported inputs</td>
</tr>
<tr>
<td>Specific Manufacturing Process</td>
<td>● Once defined, clear and unambiguous &lt;br&gt;● Provides for certainty if rules can be complied with</td>
<td>● Documentary requirements can be burdensome and difficult to comply with. &lt;br&gt;Leads to product specific rules. &lt;br&gt;● Domestic industries can influence the specification of the rules.</td>
<td>● The formulation of the specific processes required – the more procedures required the more restrictive &lt;br&gt;● Should test be negative (processes or inputs which cannot be used) or a positive test (what can be used) – negative test more restrictive.</td>
</tr>
</tbody>
</table>

Source: Notes on Rules of Origin with Implications for Regional Integration in South East Asia by Paul Brenton, 2003
There are other tests utilized for different types of products. Some FTAs also apply so-called “hybrid tests” which require both a minimum percentage of domestic value-added content plus a change in tariff classification for a product to undergo a “substantial transformation.” (Coyle 2004). On the other hand there is the more liberal either/or test, which provides a choice about which rule to use (alternative rule). Given that there are no internationally agreed standards, an importing country can vary rules of origin according to its trading partners and products.

Additional typical features of ROOs are also utilized to simplify or refine the process of conferring origin. Examples of these are provisions allowing a certain degree of de minimis, the roll-up principle and various types of cumulation. The de minimis rule allows for a specified maximum percentage of non-originating materials to be used without affecting origin. Roll-up or absorption principle allows materials that have acquired origin by meeting specific processing requirements to be considered originating when used as input in a subsequent transformation. (Estevadeordal and Suominen 2003) Finally, cumulation (also known as accumulation) is a measure that permits countries to use inputs from a specific country or group of countries without affecting the origin of the products. In essence, cumulation provisions permit inputs to be obtained from outside the FTA and be counted as domestic for the purposes of determining the origin of the product. (Coyle 2004)

There is a growing trend in the use of the cumulation type of ROO-- in particular, the diagonal cumulation which expands the geographical and product coverage of an ROO regime in FTAs. The traditional interpretation of this diagonal cumulation is to permit three or more countries to effectively merge their individual bilateral treaties into a single comprehensive FTA in which inputs can be sourced anywhere within the network. The issue raised however is whether this should benefit a non-party to the FTA as in the case of US-Singapore Integrated Sourcing Initiative

**Sensitive Sectors in ROOs**

It is mainly with respect to sectors like textiles and clothing, agricultural and automotive products which are most especially sensitive to the type of ROO adopted. These are the sectors usually accorded higher tariff (and often also non-tariff) protection, leading to concerns of protectionist capture in the design of the ROO. (OECD 2002) Ironically, or maybe not, these sectors are also where the FTA would have highest impact. The ROO is

---

6 There are three types of cumulation. Bilateral cumulation operates between the two FTA partners and permits them to use products that originate in the other FTA partner as if they were their own when seeking to qualify for preferential treatment. Diagonal cumulation means that countries tied by the same set of preferential origin rules can use products that originate in any part of the area as if they originated in the exporting country. Full cumulation provides that countries tied by the same set of preferential origin rules among each other can use goods produced in any part of the area, even if these were not originating products. (Estevadeordal and Suominen 2003)
especially relevant in the case of textiles and clothing given the elimination of quota allocation in the Multi-Fibre Arrangement (MFA).

NAFTA’s ROO regime is particularly complex and the most complicated rules apply to special cases, including the so-called “maquiladoras” and the special regime covering textiles and clothing. The basic rules are so-called “yarn forward” and “fiber forward” rules according to which textiles and clothing products are deemed originating provided they are made of yarn or fiber produced in the area which would include all the cutting and sewing. (Krueger 1993) Apparel products imported into the US must satisfy a “triple transformation” rule requiring domestic content at each one of three transformation stages: fiber to yarn, yarn to fabric and fabric to garment. (Cadot et al 2002) An examination of US ROOs would contain these rules although there are some 3rd country allowances to countries like Israel, Morocco and Jordan.

The next section looks at the different ROO regimes in East Asia. This would provide an idea about the initial conditions in the region.

3. INVENTORY AND COMPARISON OF ROO REGIMES IN EAST ASIA RTAS

ASEAN represents the largest grouping involving the East Asian countries. In addition, most of the other arrangements in East Asia would revolve around ASEAN, such as the “ASEAN+1” agreements namely the ASEAN-China agreement, ASEAN-South Korea, and ASEAN and Japan; and as the East-Asia-wide initiative under the “ASEAN Plus Three” (APT) mechanism.

In the case of bilateral agreements among East Asian countries, the most prominent are the various bilateral economic partnership agreement (EPA) being forged by Japan with individual ASEAN country, in parallel with its ASEAN-Japan track. This includes five which have been concluded and in force (with Singapore, Malaysia, Thailand, Indonesia and Brunei). The Japan-Philippine EPA has been signed but as yet to be ratified by the Philippine Senate and Japan’s EPA with Vietnam is in the process.

➢ ASEAN (AFTA) ROO

The AFTA ROO provides that:

---

7 Maquiladoras is a term referring to production units doing offshore assembly work for the US market. Generally, they are US owned companies enjoying preferential tariff treatment in the US before and even during the early years that NAFTA was formed. (Cadot et al 2002)
(i) A product shall be deemed to be originating from ASEAN Member States, if at least 40 percent of its content originates from any Member States;

(ii) Locally-procured materials produced by established licensed manufacturers, in compliance with domestic regulations, will be deemed to have fulfilled the CEPT origin requirement; locally-procured materials from other sources will be subjected to the CEPT test for the purpose of origin determination;

(iii) Subject to sub-paragraph (i) above, for the purposes of implementing the provisions of Rule 1 (b), products worked on and processed as a result of which the total value of the materials, parts or produce originating from non-ASEAN countries or of undetermined origin does not exceed 60 percent of the FOB value of the product produced or obtained and the final process of manufacture is performed within the territory of the exporting Member State.

As observed by Estevadeordal and Suominen (2003), the AFTA ROO is prominent for its generality in application, originally utilizing just the single method of value-added criterion. It provides for 40 percent regional value added content (RVA) to qualify as originating good for non-wholly produced or obtained goods. At least on paper, the rule is simple and relatively generous provision for imported inputs. The main reason for this is the reliance of most member countries on electronics and textile and garments for their exports, products produced within GPNs accounting for low value-added/local content, such that even 40 percent value added (VA) may be too high.

ASEAN is also further refining its cumulation rule and developing a “partial” cumulation approach— that is, even goods of “partial” origin not having satisfied the 40 percent threshold can be cumulated as part of RVA. The practice in ASEAN is to count “components as part of ASEAN content which themselves have ASEAN content of 40 percent or more.” ASEAN has now agreed to the percentage content requirement reduced to 20 percent of ASEAN content.

This move is envisioned to help most developing ASEAN member countries, whose sources of inputs, given the GPN structure would come from outside the region. Some estimates show that in most ASEAN countries, for major manufactured exports (e. g. textile, garments and electronics) total ASEAN content is less than 20 percent . (Manchin and Pelkmanns-Balaoing, 2007)

Hence, in general, reforms to simplify the ROO are continuously being sought. However, there are no provisions as yet for the treatment of duty drawback or the Absorption or Roll Back principle.

Recently, ASEAN has also adopted the substantial transformation rule (i.e. change in tariff heading as an alternative criterion to the general value added rule to keep pace with the changing global and regional environment, ASEAN currently has substantial
transformation rules for wheat, flour, aluminum, products, iron and steel products, textile and clothing, electronics, as well as rubber and wood based products.

JETRO (2004) on ASEAN’s FTAs and Rules of Origin reports some improvement in the share of CEPT exports. It noted that the share of CEPT exports to total ASEAN exports more than doubled from 10.8 percent in 2002 to 22.5 percent in 2003. This likely indicates better utilization of the CEPT preference. This could also indicate that reforms undertaken do matter.

- **ASEAN + 1 ROO**

In addition to the ASEAN Free Trade Area, ASEAN as a whole is also engaged with various Dialogue Partners to implement or discuss free trade areas under the “ASEAN plus” framework. Agreements have been signed with China (ACFTA) and Korea (AKFTA) and Japan.

Both ACFTA and AKFTA adopt the general 40 percent local/regional value added (RVA) rule, with full cumulation. They also provide for alternative rule using CTC for certain products. The progression from AFTA to ASEAN plus one, thus far, has been towards more flexibility (and thus less restrictiveness). The ACFTA ROO is more flexible (and less restrictive) than AFTA ROO covering a larger number of products with alternative CTC rule. These include 424 (HS6) textile and textile products items, 2 items of preserved fish, 6 items of wool, 22 of leather goods, 14 for furskins and 4 item lines of footwear. The AKFTA appears even more liberal with even larger product coverage allowed to use CTC as an alternative rule (except for a few cases in the automotive sector where the RVA requirement is 45 percent). It even introduces the novel approach of back-to-back Certificate of Origin (CO) for re-exports of partner A into partner B of products which was first exported by partner C into A, e.g. transit exports of Singapore from another ASEAN country. (Manchin and Pelkmans-Balaoing, 2007)

A continuing trend toward a more liberal approach would bode well for the achievement of a best-practice East Asia ROO.

- **Bilateral FTAs among East Asian countries**

Among the northeast countries (China, Japan and Korea), Japan has been the most active in pursuing bilateral agreements with other East Asian countries, specifically ASEAN-6 and Vietnam. Its strategy is to follow a dual track approach of forging bilateral partnership with individual ASEAN country along side negotiating an agreement with ASEAN as a group. A number of reasons have been cited, including the most practical one of threshing

---

8 Singapore and Thailand are of course more prolific, starting much earlier on in their pursuit of bilateral agreements, but Japan has been the more active with respect to forging partnerships with other East Asian countries, as Singapore and Thailand are already being a member of ASEAN.
out first the details and difficult areas with specific countries, which would pave the way for a smoother implementation of an ASEAN-Japan partnership. The bilateral agreements forged by Japan with individual ASEAN countries are intended to be incorporated (as annexes) in the ASEAN-Japan FTA (AJEPA). If individual EPAs are not completed by the time AJEPA is concluded, the ROO will not be open to renegotiation.

The advantage of the dual track approach of Japan is the opportunity for one country to demand more flexible terms from Japan than what would otherwise happen in negotiating as a group. However, this is also a disadvantage since in all probability, a non-uniform outcome per industry across country would result, which would make consolidation difficult later on. While ACFTA and AKFTA are in essence also a series of bilateral agreements, with each country having bilateral negotiations with China and Korea in terms of preferences, at least, the ROO regime would be uniform per product. And as it turns out (as earlier discussed), what has emerged is even more liberal ROO regime than AFTA.

In examining Japan’s bilateral with individual ASEAN countries, the trend is similar, although generally more restrictive. The earliest of Japan’s EPA, that with Singapore, is indeed generally more restrictive than the newer EPAs of Japan. JSEPA (Japan-Singapore EPA) is characterized by particularly complex ROO especially for agricultural products, textiles and apparel. (Manchin and Pelkmans-Balaoing, 2007). Majority uses mainly the change of tariff heading rule defined for specific products. Alternative RVC rule is allowed for a few products but at a high rate of 60 percent and where it is lower than 40 percent, the RVA rule is an additional rule. However, Singapore and to a lesser extent Japan, already have duty-free MFN status so that the ROO regime (and for that matter, the preferential treatment) is almost immaterial. *De minimis* is also provided for, but as a product specific rule.

Japan’s more recent EPA has less restrictive ROO compared to JSEPA. The general rule is the CTC approach, defined for specific products, but in many cases, an alternative VA rule of 40 percent as in AFTA is used. As in JSEPA, there is provision for *de minimis*, but as a product specific rule.

Kawai and Wignaraja (2007) provide an overview of the main ROOs adopted by 30 concluded FTAs in East Asia. Their summary table is reproduced here as Table 2 below. Their study notes that majority of FTAs in East Asia (20) have adopted a combination of the three ROOs rather than applying a single rule. The AFTA and the ASEAN-PRC FTA use what they consider the simplest ROO—the VA rule, which specifies a 40 percent regional value content across all tariffs. They observe that the developed countries in East Asia, namely Japan, Korea and Singapore, tend to use a combination of ROOs, adding to the complexity and costs for business.

With respect to types of products, they provide some additional insights. For example, they note some variation in the case of major automotive and automotive parts in 11 major concluded FTAs (see Table 3- lifted from Table 10 of Kawai and Wignaraja, 2007). The
VA rule is generally 40 percent for AFTA and ASEAN-China, but higher for ASEAN-Korea at 45 percent. The VA criterion is 60 percent in Japan-Malaysia for HS8703 and 8711 in contrast with 40 percent in Japan-Thailand FTA for the same two products. There are similarly instances in the case of Singapore-Australia FTA and Thailand-Australia FTA.

In sum, some key observations can be gleaned from examining the ROO regimes in the various FTAs in East Asia:

- Significant variance exists among ROO provisions
- ROO complexity and costs compounded across multiple FTAs or within overlapping agreements
- The relatively simple and liberal ROO provision of AFTA, and the generality in application. In addition, reforms being sought lean towards more liberal rules by “expanding/easing standards”
- The existing FTAs in East Asia (again, limited to ASEAN-10 plus China, Japan and Korea) are more or less consistent with AFTA ROO, with the use of 40 percent RVA.
- Most sensitive sectors for most countries include automotive, textile and garments sectors.
- There is a trend toward using CTC as an alternative rule, albeit being defined for product specific countries.
- Japan appears to have greater tendency for more restrictive ROO.
- However, in general, there is a trend towards progressively more liberal ROO regime in East Asia.

Notes: The general rules of origin of the FTA are adopted when there is no Specific Product (SP) rule provided. CTH=Change of Tariff Headings; RVC=Regional Value Content; VC=Value content.

Source: lifted from Table 10 in Kawai and Wignaraja, 2007. ASEAN+3 or ASEAN+6: Which Way Forward?
4. RECURRING ROO ISSUES

The impact of ROO depends on:

- the margin between preferential tariff rates and MFN applied rates - as the MFN rates are reduced, the average margin of preference measured as the difference between the MFN rate and the concessional rate also decreases. A margin of preference of zero indicates that the MFN and preferential rates are the same and origin would play no part in the purchasing decisions of importers. A positive margin of preference indicates that MFN rate exceeds the preferential rate, and origin would play a part in those decisions. The higher the margin of preference, the more important determination of origin is for decisions about purchasing;

- the overall stringency of the origin criteria for conferring origin - the more stringent the rules the more difficult it will be for the parties involved to avail of the tariff concessions;

- the extent to which prescriptive ROO are used to limit the effects of preferential tariffs to members, e.g. supplementary accounting procedures to meet information and monitor compliance with original rules. While this may be relatively straightforward for large companies/exporters, this may discourage smaller exporters from seeking preferential entry.

The direct impact of ROO would be on trade and investments.

With respect to trade, the ROO will have little or no effect on trade in agricultural produce or other products that are clearly “wholly produced” or where MFN tariff is zero, or close to zero.

For some firms, the margin of preference will be sufficient to induce them to accept a less favorable input mix and a higher cost structure in order to obtain preferential access for their exports of finished goods to other countries in the FTA.

Other firms may forego preferential treatment for their final products in the FTA market by continuing to obtain inputs from the preferred suppliers outside the FTA area. They may judge that the compliance costs and efficiency losses involved in changing input sources.

With respect to investments, ROO can induce changes in the location of production between member countries of an FTA. Some production may be relocated from outside the FTA in response to a desire to meet origin requirements and make that production eligible for duty free access to the FTA markets.
Where ROO effectively allow minimal or no third country inputs (as in the case of sensitive sectors such as automotives, textiles, and clothing), producers in member countries may have little choice but to establish domestically-focused (import competing) operations with majority of the inputs obtained locally.

It has also been documented that depending on how the ROO is formulated it can perpetuate inefficiencies. Some firms may find that their efforts to lower costs and increase productivity through technical innovation and improved business practices can prove to be a disadvantage to them in meeting the requirements of the ROO. For example, a firm may find that through increased productivity it can no longer meet the 40 percent local content threshold. It could also be penalized if it purchased inputs more cheaply from preferred sources worldwide. It would seem that to continue to benefit from preferential tariff treatment firms would be required to retain less efficient production patterns.

With globalization and advances in ICT (information and communication technology) leading to growing international production sharing, amidst the increasing trend in preferential trading arrangements, the administration of ROO has been beset with difficult recurring issues which are increasingly becoming an urgent concern.

• **Issue of Spaghetti (Noodle) Bowl Effect**

The technical nature of the ROO makes it per se difficult but the variations across FTAs (as discussed above) and the labyrinth rules make it even more problem-ridden. Precisely, it is the number and disparities of ROOs which give rise to the spaghetti bowl effect. Such overlap and inconsistency of the ROO systems must be addressed if one is to address trade facilitation issues.

• **Cost of Administration**

Even without the spaghetti-bowl effect, costs of implementing ROO could be substantial. Estimates vary: 3 percent of the value of goods traded for EFTA countries (Herin, 1986), between 4-4.5 percent (Manchin 2006) and 6-8 percent (Cadot et al., 2005) for other EU schemes. For NAFTA, Carrère and de Melo (2004) estimates the cost of ROO to be around 6 percent of the value of goods traded. Manchin and Pelkmans-Balaoing, using a gravity model, finds that in ASEAN, for the preferential trade to positively influence trade flows, the margin of preference should be higher than 25 percent, suggesting an equivalent cost of ROO administration and compliance in ASEAN, much higher than estimates for EU and NAFTA.

Various ROO regimes would differ in their administrative requirements which would entail varying demands among exporters and importers alike. Compliance to the rules set may be difficult enough (whether VA, CTC or some other variation which would have different degree of restrictiveness). This is further expounded by the burdensome administrative process of verification and certification, and which may vary with the partner trading...
country. Usually, a certification serves as a verification of the origin of a given product. Hence, the type of certification adopted would have implication on the facilitation of trade. Some types (as in the case of EU’s two-step system) require heavier involvement by the exporting country government and increase the burden of the exporters. On the other hand, there is the increasing adoption of a “self-certification” model (certified by a public or a private umbrella entity approved by the government) which entails lower administrative costs to exporters and government by transferring the burden of proof of origin to the importers themselves. (Estevadeordal and Suominen 2003) However, this method could be too untraditional for most ASEAN countries and its acceptability may pose a problem.

Another issue aside from cost is the potential arbitrariness in the process. Verification of origin is generally done at the national level in accordance with guidelines agreed upon in the ROO of the FTA. This mechanism creates several sources of rents, as the guidelines for valuing the final product and the domestic inputs are generally vague and can thus be manipulated and interpreted differently by national authorities, which have wide discretion in applying these rules (or even in the case of valuation of inputs), and can do so arbitrarily. (ADB 2002)

In any case, the differences in the rules and how they are administered, not just across but within countries would entail confusion and more likely result in the limitation of potential market depending on its consistency with one’s domestic policies. It is thus logical for countries engaging in numerous FTAs to adopt uniform rules of origin. Indeed, it makes coordination in ROO regimes in the region imperative.

- **ROO as a protectionist tool: differential impact of restrictive/lax rules**

ROO can either facilitate or restrict trade depending on the adoption of permissive or restrictive rules. In designing the ROO, a country can increase or decrease the degree of restrictiveness of ROOs using certain provisions—e.g. the preparation of a separate listing of operations that are in all circumstances considered insufficient to confer origin such as simple operations of cleaning, packaging and labeling; the prohibition of duty drawback which preclude the refunding of tariffs on non-originating inputs that are subsequently included in the final product exported to a FTA partner market; and the imposition of high administrative costs. (Estevadeordal and Suominen 2003) In this regard, ROOs could be used as a protectionist trade instrument. Since ROOs are negotiated industry by industry, there is enormous scope for well-organized industries to essentially insulate themselves from the effects of the FTA by devising suitable ROO. Political variables that arbitrate the level of tariff and trade protection could come into the picture and affect the restrictiveness of ROOs. This has been suggested to be the case for developed countries, e.g. the EU and the United States. A report by Australian Productivity Commission found ROO laws under the two Australian FTAs (the United States and Thailand) are possibly among the most
restrictive in world trade. Furthermore, agricultural products and textiles and apparels appear to have relatively more restrictive ROOs. (Estevadeordal and Suominen 2003)

- **Issue of Investment diversion**

ROOs could be an important determinant of specialization patterns in preferential trade agreements. Restrictive ROOs could create an incentive to increase the amount of intermediate and final good manufacturing, processing and assembly done within the preferential area at the expense of the facilities in the other country which would otherwise have a comparative advantage. Firms base their decisions on production and location on country’s trade protection creating an incentive for trade diversion in favor of a particular FTA to avail of the preferential treatment. (ADB 2002) Furthermore, this may encourage intra-FTA producers to shift to suppliers in the cumulation area. (Estevadeordal and Suominen 2003) This distortion causes an inefficient allocation of global resources. (La Nasa 1995).

It has been documented that depending on how the ROO is formulated, it can perpetuate inefficiencies. Some firms may find that their efforts to lower costs and increase productivity through technical innovation and improved business practice can prove to be an advantage to them in meeting the requirements of the ROO. For example, a firm may find that through increased productivity it can no longer meet the national/regional value content threshold. It could also be penalized if it purchased inputs more cheaply from preferred sources worldwide. It would seem that to continue to benefit from preferential tariff agreement, firms would be required to retain less efficient productions patterns.

- **Treatment of Duty Drawback**

Related to the issue of trade and investment diversions is the treatment of the duty drawback. Most preferential agreements prohibit duty drawbacks granted to non-originating materials used in the production of a final product for export to partner country. This policy discourages the use of third country inputs in the production processes and thus contributes to allocation inefficiencies. In addition, it could be very important for countries with heavy production links with third party manufacturing networks. Clearly, the policy on duty drawback reflects ROO restrictiveness and protectionist tendencies of receiving countries. The most affected would be an exporting developing country partner.

These are just some of the major issues which the “new age” cooperation initiatives would need to deal with. Detailed issues about its administration can be even more important to actual trader and importer. Nonetheless, it is crucial that these general concerns be addressed in a rational framework when setting the ROO regime for EAFTA.

---

5. CONCLUSIONS AND RECOMMENDATIONS

Estimates of ROO costs vary. Herin (1986) estimated the cost to be around 3 percent of the value of goods traded for EFTA countries. Manchin (2006) estimated a range between 4-4.5 percent and Cadot et al (2005) between 6-8 percent for other EU schemes. For NAFTA, Carrère and de Melo (2004) estimated the cost of ROO to be around 6 percent of the value of goods traded. Manchin and Pelkmans-Balaoing, using a gravity model, finds that in ASEAN, for the preferential trade to positively influence trade flows, the margin of preference should be higher than 25 percent, suggesting an equivalent cost of ROO administration and compliance in ASEAN, much higher than estimates for EU and NAFTA.

JETRO surveys in ASEAN countries note the considerable amount of time and paperwork involved in obtaining Form D (the official form to prove origin in AFTA). Compliance with ROO involves numerous documentation requirements (including invoices and other evidence for each input used in the final product). These problems are magnified for small firms. In addition, ASEAN requires that Form D should be issued by designated government departments, unlike many other FTAs where private sector associations are allowed to issue certificates of origin. The 2006 JETRO Survey of Japanese Firm’s International Operations shows that around 30 percent of 97 Japanese MNCs surveyed using or planning to use FTA preferences in East Asia view the existence of different rules of origin as complicating their trade businesses and leading to increased costs—either through having to deal with complicated procedures to prove country of origin or even having to change to productions processes. Another 33 percent expected to see increased costs in the future. Furthermore, 64 percent of firms thought that rules of origin should be harmonized, with the largest number (24.7 percent) preferring to be able to choose either the value added (VA) rule or the change in tariff classification (CTC) as the common rule. Thus, it seems that multiple ROOs are beginning to manifest themselves as a problem in East Asia. (Kawai and Wignaraja, 2007)

Therefore, to achieve significant benefits in terms of reduction of the cost of doing business across the region and seamless trade and production it would be necessary to rationalize the differing rules of origin in the various FTA’s in the region. Consolidation of multiple membership agreements around more liberal rules of origin will serve a tool for diminishing spaghetti bowl related cost of trading under preferential regime.

RECOMMENDATIONS:

The ROO regime for EAFTA should be premised on the principle that it should lead to the reduction of the cost of doing business across the region and promote seamless trade and production. Towards this and the ROO regime for EAFTA should entail the following key features:
• Simplicity and Efficacy

There is a consensus that the movement should be towards more simple and unrestrictive ROO. Simpler ROO will help promote regional trade and international competitiveness of member states. Simple rules will reduce compliance costs and administration itself of trade and customs procedures. To minimize the potential for unproductive rent-seeking and corruption, a simple and transparent ROO is important. (ADB 2002)

In general and in theory, this means using a single, least restrictive rule. But in practice using an either/or approach might be more practical.

In this regard, the use of CTC as an alternative (either/or) method to the VA rule would help. The CTC method is easy for Customs authorities to implement. At the same time, SMEs might also find it easier to comply with, simply needing to show import and export invoices with different classification code. The question is determining the level of disaggregation the member countries would deem to satisfy “substantial” transformation, which would vary across commodities. Here, protectionist tendencies would surface and agreements (especially between developed and developing countries) might be difficult. Nonetheless, the general rule should lean towards less restrictiveness. This implies using a common rule across products, possibly at a 4 to 6-digit level, and if any, with very limited product-specific exemptions.

The reforms in ASEAN ROOs appear to be heading toward this direction. It has started to introduce CTC as a substitute criterion. Earlier the product coverage is limited to: iron & steel products in HS Chapter 72, textiles and textiles products, wheat flour, aluminum and wood-based products. An increasing number of products are now being covered to apply CTC as alternative criteria to the VA rule for products in additional nine priority sectors, namely: (i) agro-based products; (ii) automotives; (iii) electronics; (iv) fisheries; (v) rubber-based products; (vi) textiles and apparels; and (vi) wood-based products.

Japan’s latest bilateral agreements with ASEAN countries has similar elements-predominantly CTC, with alternative use of VA for most. The problem would be the different levels of disaggregation used and it is doubtful how liberalizing the regime could be. In any case, it appears that Japan’s plan is to more easily consolidate the ROO into a Japan-ASEAN ROO.

Another suggestion being considered in various FTAs is the use of self-certification. It is not without its own problem, as previously mentioned, but this would simplify and lighten the administrative burden considerably.

Finally, de minimis rules (which allow for a specified maximum percentage of non-originating materials to be used without affecting origin) can greatly simplify ROO. It could be set well within a level for the intent and purposes of “substantial transformation” but a higher cut-off would represent a more liberal approach to ROO.
While the use of *de minimis principle* appears to become a common feature in newer partnership agreements, upon closer examination, application is usually on a product specific (PSR) basis. A wider application of *de minimis* rule using generous ceiling would be a major step to simplifying ROO and lowering the cost of compliance.

**Flexibility**

Internationalization of production and accompanying technological changes would require periodic revision of the ROO, especially in product groups where technologies and production processes change fast. ROO should be flexible enough to accommodate these changes. Nonetheless, product specific rules should be avoided. Otherwise, there would be a tendency of “privatization” of trade policy brought about by the need for periodic revision. There should at least be some well-defined procedures or guiding principles for introduction of amendments in the harmonized ROO. Again, in practice, an either/or approach might be useful.

**Accumulation Rule**

One important consideration is the adoption of a full cumulation type ROO. Full cumulation is an important factor allowing for the development of regional production networks. This provides for deeper integration and allows for more advanced countries to outsource labor-intensive production stages to low-wage partners. Coupled with simple ROO, this full cumulation will make it easier for regionally-based firms to exploit the economies of scale. (Brenton 2003)

ROO provision for cumulation (referred to as well as accumulation) would be a crucial feature to include in a regional trading agreement. It would address problems of protectionist tendency in the ROO and investment (and trade) diversion effects, at least within the wider grouping of member countries. An issue is how to deal with non-member countries. To what extent should cumulation be allowed so as not to frustrate the preferential status of the FTA partners? Should this follow the traditional Pan-European system or the more aggressive US-Singapore ISI? What combination of policies or rules is acceptable? The easy answer is to include a guiding principle, for example, a development dimension in these rules involving simple interpretation.

Aside from accumulation, roll-up or absorption principle which allows materials that have acquired origin by meeting specific processing requirements to be considered an originating good when used as input in a subsequent transformation could also be recommended for a more liberal ROO approach.

For its part, ASEAN is developing a “partial” cumulation approach. The practice in ASEAN is to count “components as part of ASEAN content which themselves have ASEAN content of 40 percent or more.” Upon recommendation during the September 2004
AFTA Council Meeting, the percentage content requirement was reduced to 20 percent of ASEAN content.

This move is envisioned to help most developing ASEAN member countries, whose sources of inputs, given the GPN (global production network) structure, would come from outside the region. Some estimates show that in most ASEAN countries, for major manufactured exports (e.g. textile, garments and electronics) total ASEAN content is less than 20 percent. (Manchin and Pelkmans-Balaoing, 2007)

• **Harmonization of Customs Procedure**

  Customs clearance is still a problem in most of the less developed countries of East Asia. A complex ROOs accompanying a free trade agreement can further complicate rather than facilitate trade in the region. Along with harmonization of ROO standards, there is even greater need for the streamlining of customs procedures and simplification of customs clearances including the introduction of paperless trading in many FTAs. The objective is to minimize documentation costs. Harmonization of customs procedures in general would be a big step in this direction. This is consistent with the principles of predictability, transparency and consistency required in the ROO.

• **Developing country Dimension**

  Establishing a regional regime of ROO for East Asia must ensure that it does not pose difficult disadvantages to the less developed developing countries. There is a need to add this dimension to the ROO regime.

  Developing countries need to be able to latch on to the GPN. This means gearing the ROO regime towards the preparation, development, and internationalization of SMEs. The ideal ROO therefore should have a developing country dimension. What would this entail? Needless to say, capacity building is crucial, for exporters, importers and administrators in developing countries, if the region is to achieve the best practice in the rules of origin. Developments in the EC for development-friendly ROO includes a single value-added method, use of statement of origin by registered exporters, and training and technical assistance to improve evaluation, information flows and monitoring of compliance. A key element is allowing alternative means of proving origin more suited to the development stage of the developing country member.

  A logical concession to developing member countries is to lower the VA criteria for its exporters. Findings for the EU shows that a decline in the value-added threshold would
tend to increase utilization rates. This could be a most useful incentive for CMLV countries.  

- Consolidation of the multiple membership agreements in the region around more liberal ROO should be the general guideline to achieve the vision of an East Asian community.
- The ASEAN ROO is considered relatively simple and liberal. The generality in application is also a plus factor. In addition, reforms being sought lean towards more liberal rules by attempts toward “expanding/easing standards.” However, a lot remains to be done to improve the system.
- The existing FTAs in East Asia (again, limited to ASEAN-10 plus China, Japan and Korea) are more or less consistent with AFTA ROO, specifically with the use of 40 percent RVA.
- In general, there is a trend towards progressively more liberal ROO regime in East Asia.
- As such, especially with continuous effort to clarify and improve issues of implementation, the AFTA ROO would provide a good starting point for EAFTA.
- Necessarily, there should be a coordinated and cooperative action among member countries.
- Rules toward adopting full cumulation, and roll-up (absorption) process should be developed. De minimis provisions should be applied more extensively. These would be significant impetus for deeper regional integration.
- Sensitivity – applying restrictive ROOs targeted at sensitive products is not an effective mechanism for protecting domestic industry and should be limited.
- Special and Differential Treatment: ROO be devised by taking into account the different levels of development of countries in the Ease Asia region
  - E.g. using lower Value added content

The various plurilateral and bilateral FTAs in East Asia have given rise to the web of complex rules of origin. Though intended to facilitate free trade promote local investment and protect sensitive local industries from “unfair competition”, in reality preferential ROO provisions in the current FTSs are overly complex and imposes unintended consequences for business.

Clearly the divergence of the ROO provisions across FTAs, their restrictiveness, complexity of the rules and requirements for compliance have remitted in more administrative costs for the public and private sector. These costs have reduced the value of the tariff preferences made available through the preferential agreements.

---

10 The value-added requirement should be based on whether the potential gains in terms of greater regional trade significantly outweigh the risks of trade deflection. Kirk (2007) suggests 30% value-added requirement would be sufficient to prevent significant trade deflection.
